Dear Examiner Funk:

Enclosed please find a Fourth Supplemental Statement of Prior Art and Other
Information with Supporting Declaration of Prince.

Very truly yours,

Robert Hardy Falk

To: The Honorable Commission of
Patents and Trademarks
Washington, D.C. 20231

Sir:

On August 11, 1994 in the concurrent Dallas litigation, a deposition was taken of Steve Garner, former President of PRI. Garner disclosed the existence of a brochure of a Canadian company in the Providence of Quebec, RDP, which brochure Garner indicated he thought taught in the "mid-1990's" a press where flexo station could be put "at any point" (Garner Deposition, p. 36). Garner indicated protestors' counsel had been given the brochure long ago, and that he had put the brochure "in an envelope probably two years ago". Garner Deposition, p. 38.

Despite our repeated request of protestors' counsel to turn over any possible relevant prior art, we again had to request counsel for pertinent art not previously considered by the PTO, including the brochure. Weeks later, the RDP brochure was "found" and belatedly produced by counsel. The brochure thereafter used by PRI in the deposition of John Bird (September 12,

2000).

Apparently Protestor PRI is playing a bizarre game - it is contending DeMoore and/or Rendlemen invented the '363 process - - and that if so reissue applicants' employer assigned the '363 process, WPC, is "infringing (count II)" its own patent - - but that if the PRI employees did not "invent" the '363 process, [it will contend] the '363 patent is invalid over the prior art.

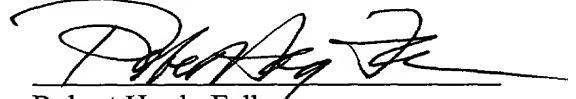

Examination of the RDP brochure (**Exhibit A** of the Prince Fourth Supplemental Declaration, attached) shows no such clear interstation flexographic teaching. The brochure may indicate it was printed in August, 1994. Nowhere is it indicated in the brochure when the brochure is distributed to the public.

Reissue applicants contend that the brochure is clearly not prior art under 35 U.S.C. § 102(b).

Furthermore, for the reasons provided by expert Prince in his FOURTH SUPPLEMENTAL DECLARATION, the brochure is not material, regardless of when it was published - - which, again, is unknown. The brochure does not clearly teach interstation development of a flexographic step. Furthermore, no interstation drying step is taught for such a step. Finally no motivation is given the artisan why, in a web-press soup-can printing operation, an interstation flexographic station would be needed in 1994, or even desired.

A PTO-1449 form is attached.

Respectfully submitted,

Robert Hardy Falk

FOURTH SUPPLEMENTAL DECLARATION OF RAYMOND J. PRINCE

I, Raymond J. Prince, declare and state under penalties of perjury the following.

1. I am the same Raymond J. Prince who has testified in previous declarations and wish to reaffirm my previous, sworn testimony.

2. I have been provided a copy of a brochure, Exhibit "A" hereto (the "RDP brochure") entitled "LF•200 Litho/Flex Press" by RDP Marathon, Inc., a foreign corporation said in the brochure to have been located at 2583 Chomedey Blvd., Laval (Montreal) Quebec H7T 2R2 Canada.

3. I am not sure from the brochure when it was printed, let alone distributed to the public. From the notation "94-08-5M", it appears 5000 copies might have been printed in August, 1994.

4. I have studied the RDP fold-out brochure, which when copied on 8-1/2" sheets amounts to six sheets and neither (a) the diagram on 1.6 above the heading "General Specifications" with the RDP addresses nor (b) the picture at the top of pages 2-4 teach a press having an interstation flexographic "station". The diagram on page 6 above "General Specifications" clearly shows a press with a flexographic station. The fold-out diagram (pp 2-4)

09315796-052301

09315796.056301
 T05250 9625100

also does not teach, in my opinion a interstation flexographic step. The two canisters at the bottom of the diagram on pp 2-3 could be supplying any type of ink, grease, varnish, coating or other liquid. They canisters could be anything.

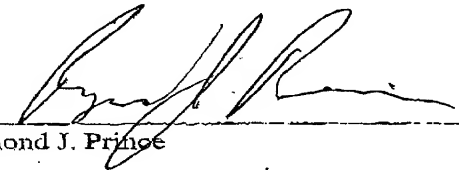

5. I note the language below the diagram at page 2 "interchangeable web offset and flexo graphic printing inserts. Does the quoted portion teach replacing any interstation offset unit with any interstation interchangeable flexo unit? Not, unless by hindsight. The picture on page 2 of the press could teach anything the reader wants it to teach by hindsight. It could read as showing a lithographic station and UV drying, or it could be read advantageously by an adversary of the '363 patent as teaching interstation flexography. No reason is given anywhere in the brochure why one would want to go "upstream", "up front" in a lithographic press with a flexo unit, as there is no express teaching of interstation drying for flexography, or for that matter, printing flexo on top of litho.

6. I called RDP in Canada and spoke to one of its representative. He said the press is still being made and is available in a 20" width with various cutoff lengths. I asked him if the flexo units are popular and the answer was yes. I asked if the flexo units were usually running waterbased materials or UV - answer was only UV inks or UV coatings. I asked the usual position of the flexo units - his answer was the last one or two units. I asked if they had ever made or sold a press with the flexo unit as the first unit - answer was no but he felt it could be done. I asked if the flexo units were ever placed mid press- answer was that he was not sure if they had ever done that. The representative told me he has never seen flexo run "up front", and seemed to be surprised at my question. I take it from my conversation with this Canadian national that he had never delivered an LF-200 with an interstation flexo unit need "up front" to a customer in the United States or elsewhere.

7. One must remember that this is a web packaging press in which heavy coverage is normally applied to low surface strength paper or board at the end of the printing process. The intended purpose for this press is *commodity packaging*, i.e., soup cans. Note the soup can

photos on page 5 of Exhibit "A". The purchaser of the press in late 1994 would have no reason to ever conceive by putting flexo down first to print a dot. In fact, the heavier coverages associated with the flexo process, in 1994, are and still today, best employed downstream.

The undersigned Declarant stated further that all statements made herein of Declarant's own knowledge are true, and that all statements made on information and belief are believe to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code.

Raymond J. Prince

LF • 200

LITHO/FLEXO PRESS

FOE250 "LITHO/FLEXO" UNIT

FOR LABELS AND FOLDING CARTONS

LF•200 LITE

The LF•200 litho/flexo combination press has been designed specifically to extend your reach into the label and folding carton market. Interchangeable web offset and flexo printing inserts—which change over in minutes without tools—provide the flexibility you need to keep production rates high. Cutoffs range from 14 to 28"/355 to 711mm, further increasing flexibility, and giving you the ability to bid on a wider range of work.

The LF•200 is available in configurations of up to 10 standard printing units with traditional finishing stations for punching, perforating, rewinding, sheeting, and folding. As a basic forms/label press, the LF•200 offers the best in narrow web offset technology. Add to this proven flexo capabilities, and you have a fast return on investment and a new capacity to compete!

Flexo Station

In a flexo configuration, the LF•200 will print on film, paper, light paperboard, and pressure sensitive stock, while achieving the high quality your customers require. Standard finishing options include die cutting and UV or aqueous-based coating. Perforating and embossing stations are also available.

Changing over to flexo is safe, and easy. No tools are required. Roll-out cartridge trolleys allow you to make room or clean up off press for maximum efficiency.

The LF•200 also gives you the ability to switch between a conventional metering roll with a reverse angle doctor blade and a full enclosed doctor blade. Choose

RDP
MARATHON inc.

RELIABLE DURABLE PRECISION

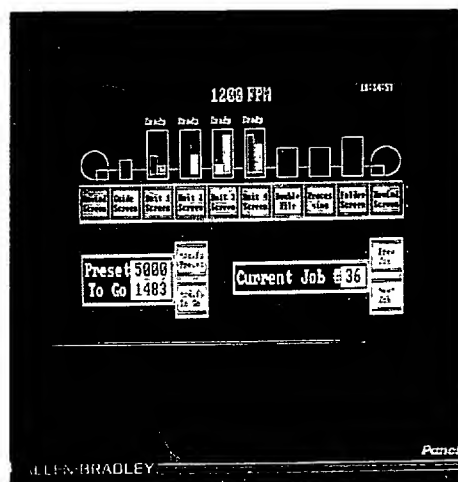

O/FLEXO CAP

most appropriate technique for the job at hand. Rigid stops eliminate plate bounce up to 800 fpm/244 mpm. Both linear and lateral register can be adjusted while running.

Flexo Station Specifications

Maximum web width	20.50" / 521mm
Side adjustment	0.25" / 6mm
Linear adjustment	360°
Plate repeat range	12-24" / 305-610mm
Anilox roll size (circ.)	17.00" / 432mm

Simple operation

Your operators need simple, time-saving controls. Our electronic control system features an easy-to-read, easy-to-use touchscreen graphic display and provides central control of virtually all press functions *plus* integration with management software. Set-up is faster, it's easier to monitor the run, and production stays on schedule—all observable from the front office. Open ended architecture means this control system won't become obsolete: it can be simply and economically upgraded at any time.

High Speed

The Maraflo™ 3-form inker, integrated dampener ensures commercial quality at speeds up to 1000 fpm/300 mpm. High speed, combined with fast make ready, makes the LF•200 extremely profitable on short and medium runs.

ABILITIES

Rigid Construction

The LF•200 has been designed to run at maximum speed, shift after shift. Steel side frames ensure a stable press which contributes both to durability and to more accurate impressions. Meticulous machining of the AGMA 12 gear train contributes as well to reliable high performance. Listen to the LF•200 in operation—it doesn't roar; it whispers!

Optional Equipment

- Automated ink key control
- Centralized register control
- Reversible die cut station
- Web monitor
- Turn bars
- Spiral folder
- Sheeter
- UV curing system
- Waterless ready
- Ink agitators
- Ink levelers
- And much more...

Quality built for the long run from RDP Marathon Inc.

RDP Marathon specializes in technical and custom engineering dedicated to quality web printers. Our goal is to serve your needs in both traditional and innovative product areas. In response to the competitive challenges you face today—and will face in the future—our family of presses offers a wide range of capabilities supported by the creative thinking that enhances your productive capacity. The SR•200, the RDP•200, and the RDP•300 series of presses provide printers with the ability to serve existing markets while exploring rapidly emerging value-added segments.

The standard of excellence established by engineering is maintained in the making of our presses, so that the high quality printer is assured of reliability, durability, and precision. We will settle for no less than your complete satisfaction with every RDP Marathon press—from customization, through installation, to after sale support.
